Infoblox

NetMRI 7.5.2 NIOS 8.6.2 Device Support List

Contents

Device Model and Version Support

The Device Support table lists the specifically verified hardware model and OS/Firmware versions and these are classified as Verified. Infoblox confirms support for these versions by testing against the make and model of a device that is listed in this document. For devices that have not been verified against a specific OS/Firmware or if the device was developed towards a specific OS/Firmware but never validated, then it is classified as Best Effort. If a Best Effort device shows a limitation or deviation in device support, a support ticket should be submitted to Infoblox for troubleshooting.

As part of the verification process, simulations are created based on the data gathered from the device when it was verified. This data is used in automated testing from release to release. As the Infoblox feature set changes, some devices are verified prior to Infoblox collecting data and testing for later features (e.g. a device that was verified against NetMRI 6.2 may never have been verified for Port Control). In some cases, a device running in an alternative mode or configuration may create a limitation or deviation in device support. For example, a device may have been verified while running as a switch, but may also run in a switch-router mode that is not verified. In such cases, a support ticket should be submitted to Infoblox to troubleshoot the issue. If you observe limitations in device support for a specific instance, configuration, or version of the device model or family; we recommend submitting a device support request RFE to have the different version supported and verified. If you have a device that is on this list that is working, but has not been verified, Infoblox welcomes your input to allow data collection from the device, to verify it, and to add it to the Infoblox testing environment.

Infoblox Feature Support

Infoblox NetMRI and Network Insight products support many discovery and management features, some of which are not supported on all devices. In some cases this is due to limitations in the managed device. In some cases, Infoblox added device support prior to the feature being developed.

The Device Support Table lists the fundamental feature support levels; in each case some detailed sub-features may not be supported for a specific device. In such cases, we indicate "Not Supported" status with an **N** in a category under the **Capabilities** column in the Device Support table. As an example, the **Configuration Collection** capability may not have been implemented due to the requesting customer not requiring support beyond SNMP identification of the device; the record for a specific device will list an **N** in that field. Infoblox software will also indicate specific data collection support for each managed infrastructure device. For example, certain SNMP data types may not be collected from a given device. In some additional cases, the specific feature may not be supportable due to limitations in vendor implementation or support of standard data collection or device interaction methods; the record for those sub-features is indicated with a "Not Supportable" label.

Device Support Table Field Descriptions

The table comprising most of this document provides a number of data columns of support information for each listed device. Explanations for values are the following:

Table 1 Device Support List Data Fields

Device Data Column	Explanation
Vendor	The manufacturer of the device.
Model	The manufacturer's model name and number of the device.
Device Type	The type of networking device, categorized by NetMRI or Network Insight ("Switch," "Switch-Router," "Router," "Firewall," and so on).
OS/Firmware	This field lists the OS/Firmware Versions that have been Verified based on the Device Model and Version support levels described above. If the field is blank, no specific versions have been verified, and the device model, family, or series must be treated as Best Effort as described above.
Capabilities	Provides three key sets of data for each listed device: **SNMP**: Successful collection of most inventory and discovery-related information. Not all SNMP data types are supported on all devices; **PortControl**: A "Y" in this column indicates that the Infoblox product supports this device for VLAN assignment, setting a port to administratively Up/Down, and defining an interface Description. In cases where the device does not allow all three settings to be changed, the record for that device indicates the allowed settings in this field. **Config Management** (NetMRI only): This column indicates the protocols that NetMRI can use to collect the device configuration. The possible supported protocols are SSH, Telnet, and HTTP. In cases where the device allows or supports only specific protocols for data collection, the record for that device indicates it in this field.
Product	Indicates whether the listed device is supported by NetMRI, Network Insight, or both platforms. Devices supported by the NetMRI product line are supported by both NetMRI and by Automation Change Manager (ACM).
Support Level	Indicates following levels of device support in NetMRI and NIOS: Validated: Infoblox device support engineers implemented the device support, tested it internally and on customer's side, and received customer's confirmation that everything works as expected. Best Effort: Infoblox device support engineers implemented the device support, tested it internally and sometimes on customer's side, but did not receive customer's confirmation that everything works as expected.
Advisor Support	Indicates if the device supports the NetMRI Advisor functionality for monitoring device lifecycle and vulnerabilities.

Global items include:

- An "N" in any column indicates that NetMRI/Network Insight does not yet directly support a given feature, conferring the status of "Not Supported." In some cases, the feature may not be supportable due to limitations in device capabilities or device-reported data.
- An "N/A" in any column indicates a particular feature does not apply to the device *type* (for example, L3 data collection is not applicable to devices of type "Switch," and port control functions apply only to switches and switch-routers.)
- A "Not Supportable" entry in the **Capabilities** column indicates a particular feature cannot be executed with the device due to adherence to non-standard methods or models that do not enable NetMRI to operate with that device feature, and is hence 'not supportable.' This value differs from "Not Supported" (**N**) described above.

If a product family or model you are interested in is not listed in this document, please contact Infoblox Technical Support for further information.

Device Support Bundles

NetMRI and Network Insight products also support a feature called Device Support Bundles (DSBs), that allows technically advanced users to support a device that is not in this list through utilization of SNMP and CLI techniques. The device itself must meet certain criteria for supportability; Infoblox recommends that customers work with Infoblox field representatives and Infoblox Professional Services to enable full support of a device using these techniques. More information on Device Support Bundles is available in the Device Support Guide feature documentation that accompanies the NetMRI and Network Insight products.

Notes on VRF Support

NetMRI 7.5.2 and NIOS 8.6.2 provide virtual routing and forwarding (VRF) support or other virtual context support for the following vendors:

Vendor	Model
Alcatel	7750 series, OS9* series
Arista	All routers and switches with L3 (routing) functions
CheckPoint	Models: VSX*
Cisco	All routers and switches with L3 (routing) functions
H3C	FF59* series
HP	Aruba series
Huawei	CX series, NE series, ATN series
Juniper	All routers and switches with L3 (routing) functions

About Known Issues

Vendor SNMP (and SSH/Telnet) support is commonly affected by, or limited by, vendor implementation of the protocol. Upgrading network infrastructure incurs costs, as does upgrading to a version that is newer than the version directly supported by Infoblox. Conversely, certain vendor firmware versions may be affected by known issues or defects that are addressed in more recent vendor releases, potentially allowing more complete support by Infoblox products. In some cases, upgrading to versions newer than those listed as supported in this document may also lead to problems with device support. Infoblox recommends consulting with Support prior to firmware upgrades to ensure continued device support, and consult your device vendor for recommendations on the latest available OS/Firmware version and their SNMP MIB and/or SSH and Telnet support.

Infoblox continuously identifies many different Vendor OS/Firmware versions that present significant issues with SNMP. That list is not presented as part of this document, owing to these issues being tied to other vendors' products. If you have questions about particular Vendor OS/Firmware versions that are not addressed in the subsections above, contact Infoblox Support and/or device vendor support for assistance.

Specific Known Issues

Some devices impose policy restrictions or licensing restrictions, preventing verification of config collection and/or port control support:

- HP VCEthernetModule (unable to verify config collection and port control)
- Nortel VSP9012 Switch-Router (unable to verify port control)
- Nortel ERS-8606 Switch-Router (unable to verify port control)
- H3C hpA512048GEI Switch (unable to verify port control)
- Force10 m-IOA Switch (unable to verify port control)
- Ruggedcom RS900 Switch (port control is not supported due to the device's CLI being menu-driven) Beginning with NetMRI 6.9.4, NetMRI supports ARP data collection through the CLI for all Juniper devices.

Infoblox Network Infrastructure Complete Device Support List

The following table represents the Infoblox Network Infrastructure Complete Device Support List to describe device support for Infoblox Network Insight and NetMRI, including platforms licensed with a feature subset (e.g. Automation Change Manager).

The table contains all the devices that are supported in NetMRI 7.5.2 and Network Insight 8.6.2.

Vendor	Model	Type	OS/Firmware	Capabilities			Product (NetMRI, Network Insight, or both)	Support Level	Advisor Support
				SNMP Data Collection	Config Collection	Port Control			
3Com	4120-26	Switch	v3.01.11.s56	Y		Y	Both	Validated	N
3Com	5500 Series Switches	Switch		Y	SSH, Telnet	N	Both	Validated	
3Com	8800 Series Switches	Switch		Y	SSH, Telnet	N	Both	Validated

NOTE: OpenSSH disabled certain legacy vulnerable ciphers that some Cisco devices and versions relied on for CLI collection. To ensure successful CLI collection for such devices, download and install the hotfix referenced as NIOS-69328 in the Infoblox Knowledge Base article 10068 at *https://support.infoblox.com*.
